## LiDAR Surveys over Selected Forest Research Sites, Brazilian Amazon, 2008-2018

### Get Data

Documentation Revision Date: 2024-05-13

Dataset Version: 1

### Summary

This dataset provides the complete catalog of point cloud data collected during LiDAR surveys over selected forest research sites across the Amazon rainforest in Brazil between 2008 and 2018 for the Sustainable Landscapes Brazil Project. Flight lines were selected to overfly key field research sites in the Brazilian states of Acre, Amazonas, Bahia, Goias, Mato Grosso, Para, Rondonia, Santa Catarina, and Sao Paulo. The point clouds have been georeferenced, noise-filtered, and corrected for misalignment of overlapping flight lines. They are provided in 1 km<sup>2</sup> tiles. The data were collected to measure forest canopy structure across Amazonian landscapes to monitor the effects of selective logging on forest biomass and carbon balance, and forest recovery over time.

This dataset contains a total of 3,154 files: 3,152 files in compressed LAS (\*.laz) file format, one file in comma separated values (\*.csv) format, and one file in compressed Keyhole Markup Language (.kmz).

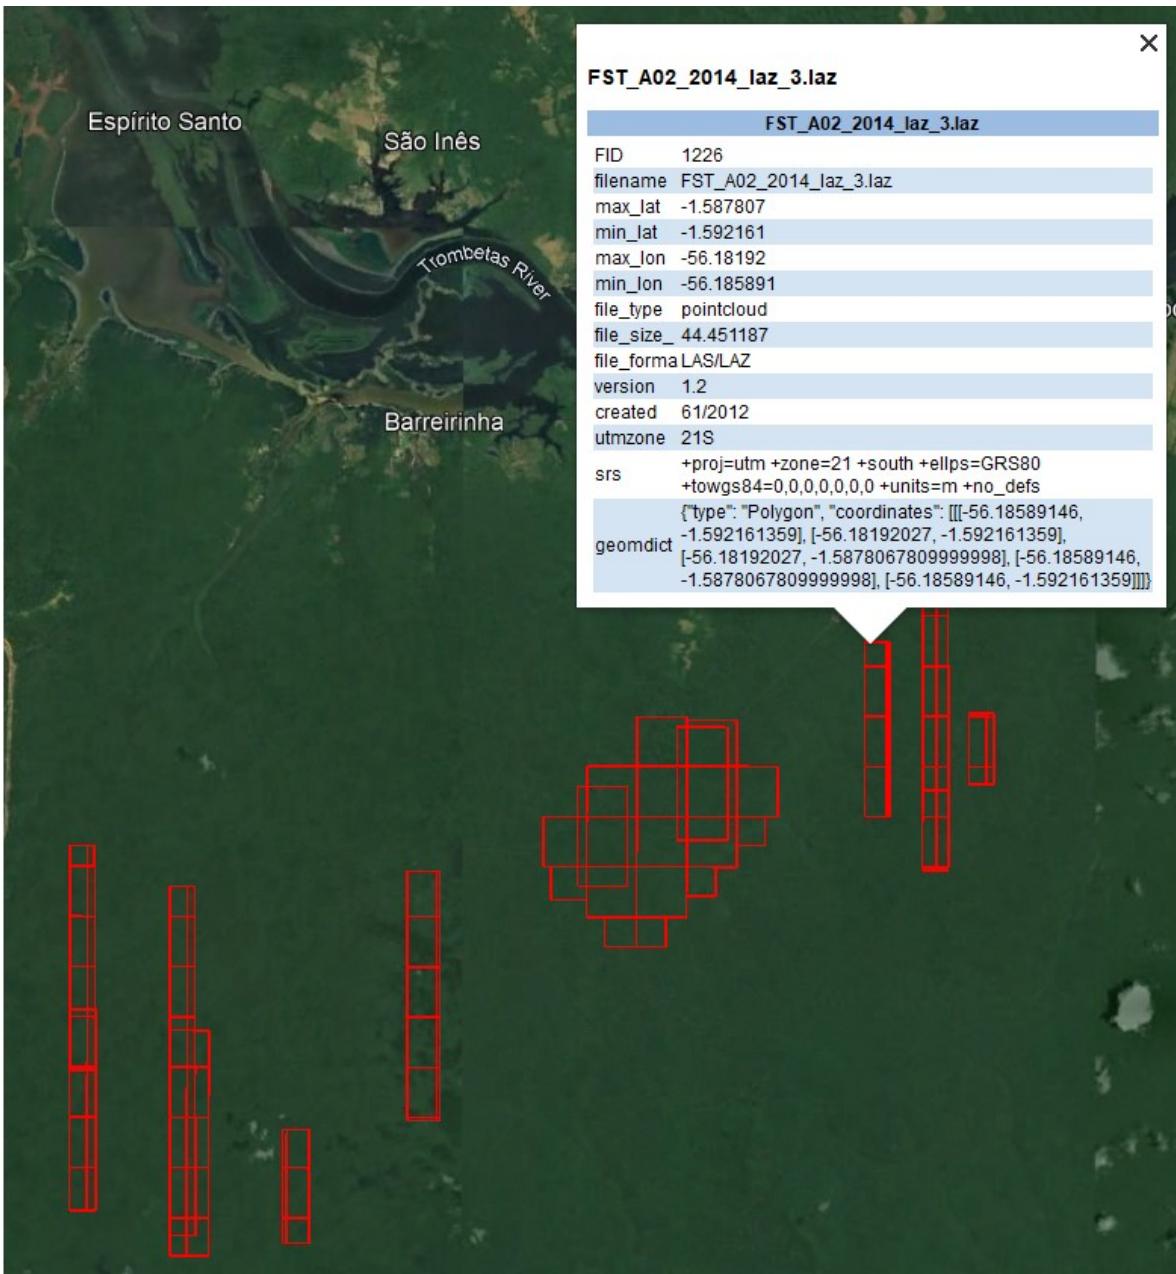

Figure 1. Bounding boxes for LiDAR tiles from surveys over western Para, Brazil are depicted in Google Earth from the KMZ file. Each feature in the KMZ provides key metadata about the corresponding tile. Source: cms\_brazil\_lidar\_tile\_inventory.kmz

## 1. Dataset Overview

This dataset provides the complete catalog of point cloud data collected during LiDAR surveys over selected forest research sites across the Amazon rainforest in Brazil between 2008 and 2018 for the Sustainable Landscapes Brazil Project. Flight lines were selected to overfly key field research sites in the Brazilian states of Acre, Amazonas, Bahia, Goias, Mato Grosso, Para, Rondonia, Santa Catarina, and Sao Paulo. The point clouds have been georeferenced, noise-filtered, and corrected for misalignment of overlapping flight lines. They are provided in 1 km<sup>2</sup> tiles. The data were collected to measure forest canopy structure across Amazonian landscapes to monitor the effects of selective logging on forest biomass and carbon balance, and forest recovery over time.

## Project: Carbon Monitoring System (CMS)

The CMS is designed to make significant contributions in characterizing, quantifying, understanding, and predicting the evolution of global carbon sources and sinks through improved monitoring of carbon stocks and fluxes. The System will use the full range of NASA satellite observations and modeling/analysis capabilities to establish the accuracy, quantitative uncertainties, and utility of products for supporting national and international policy, regulatory, and management activities. CMS will maintain a global emphasis while providing finer scale regional information, utilizing space-based and surface-based data.

### Acknowledgements:

LiDAR surveys performed through the Sustainable Landscapes project were commissioned by the United States Forest Service in collaboration with the Brazilian Enterprise for Agricultural Research (EMBRAPA) (<https://www.paisagenslidar.cnptia.embrapa.br>) and are archived through the Carbon Monitoring System project funded by NASA.

## 2. Data Characteristics

**Spatial Coverage:** Selected areas of the Amazon Basin and other regions in Brazil

**Spatial Resolution:** ~ 10 points per m<sup>2</sup> provided in 1 km<sup>2</sup> tiles over key field research sites

**Temporal Coverage:** June 2008 to August 2018

**Temporal Resolution:** single acquisition over most sites (multiple acquisition over some sites)

**Study Area:** (all latitude and longitudes given in decimal degrees)

Site	Westernmost Longitude	Easternmost Longitude	Northernmost Latitude	Southernmost Latitude
LiDAR flightlines over Brazil	-68.2897	-39.058	-1.5794	-26.6964

### Data File Information

This dataset contains a total of 3,154 files: 3,152 files in compressed LAS (\*.laz) file format, one file in comma separated values (\*.csv) format, and one file in compressed Keyhole Markup Language (.kmz).

The LAS files hold LiDAR data (Table 1).

The files *cms\_brazil\_lidar\_tile\_inventory.csv* and *cms\_brazil\_lidar\_tile\_inventory.kmz* provide summaries of the LAS file contents in tabular form (.csv) and as viewable using Google Earth (.kmz) (Table 2). Both files provide similar information about the LiDAR inventory.

#### LAS File characteristics

**File organization and naming convention:** Files are organized according to the **Survey\_reference\_code** given in Table 1 below.

For example, the reference code **ANT\_A01\_2011\_LiDAR** associates the \*.las data files collected at the "Floresta Estadual do Antimary" research site in 2011 with the metadata **uuid** shown in Table 1.

Please refer to the Sustainable Landscapes metadata for the definitions of the 3-character site codes and additional site descriptions.

File names begin with their respective **Survey\_reference\_code** and end with a sequential number identifying the specific 1 km<sup>2</sup> tile data provided.

- ANT\_A01\_2011\_laz\_0.laz
- ANT\_A01\_2011\_laz\_1.laz
- ...
- ANT\_A01\_2011\_laz\_11.laz

Note: not all file names follow this structure. Please refer to specific survey reference code Sustainable Landscapes metadata for details about these alternatively-named files.

**File format:** The LAS standard is developed and maintained by the American Society for Photogrammetry and Remote Sensing (ASPRS; <https://www.asprs.org/divisions-committees/lidar-division/laser-las-file-format-exchange-activities>) and is currently on version 1.4. These data are distributed in LAS versions 1.0 through 1.2.

**Table 1.** LiDAR survey information. The **Survey\_reference\_code** associates the \*.las data files collected at a research site in a given year . The WebGIS of the **Sustainable Landscapes Brazil** project provides capabilities for finding LiDAR and related field data.

```

**Table 2.** Variables in *cms\_brazil\_lidar\_tile\_inventory.csv* and *cms\_brazil\_lidar\_tile\_inventory.kmz*.

Field	Description
filename	filename
max_lat	maximum latitude extent (decimal degrees)
min_lat	minimum latitude extent (decimal degrees)
max_lon	maximum longitude extent (decimal degrees)
min_lon	minimum longitude extent (decimal degrees)
file_type	always "pointcloud"
file_size_mb	size of the file in megabytes
file_format	always "LAS/LAZ"
version	LAS specification version (always from v1.0, v1.1, v1.2)
created	file creation date
utmzone	UTM zone given as "##S" (always from 19S, 20S, 21S, 22S, 23S, 24S )
srs	proj4 string for the UTM zone

### 3. Application and Derivation

These LiDAR acquisitions are meant to measure forest canopy structure across Amazonian landscapes to monitor the effects of selective logging on forest biomass and carbon balance and forest recovery over time.

### 4. Quality Assessment

Checks for horizontal and vertical accuracy, and other standard quality control measures were performed by affiliated LiDAR survey vendors. Please refer to <http://mapas.cnpm.embrapa.br/paisagenssustentaveis/> for vendor information.

### 5. Data Acquisition, Materials, and Methods

#### Project Overview

Brazilian tropical forests contain approximately one-third of the global carbon stock in above-ground tropical forest biomass. Deforestation has cleared about 15% of the extensive forest on the Brazilian Amazon frontier. Logging, and understory forest fires may have degraded a similar area of forest. In response to the potential climatic effects of deforestation, policy makers have suggested reductions in emissions through deforestation and forest degradation and enhanced forest carbon stocks (REDD+). Carbon accounting for REDD+ requires knowledge of deforestation, degradation, and associated changes in forest carbon stocks.

Degradation is more difficult to detect than deforestation. This LiDAR inventory will continue to help researchers to quantify carbon stocks and changes and associated uncertainties in the Brazilian Amazon.

## LiDAR Acquisition

LiDAR surveys were flown between June 2008 and August 2018. The data were collected and processed to point cloud files by commercial vendors under several grants, and incorporated into the broader integrated effort of the Sustainable Landscapes project. Sustainable Landscapes is supported by the United States Agency for International Development (USAID) and US Department of State. LiDAR surveys performed through the Sustainable Landscapes project were commissioned by the United States Forest Service in collaboration with the Brazilian Enterprise for Agricultural Research (EMBRAPA) and are archived through the Carbon Monitoring System project funded by NASA.

EMBRAPA maintains a metadata portal for the Sustainable Landscapes project at: <https://www.paisagenslidar.cnptia.embrapa.br/webgis/>.

## 6. Data Access

These data are available through the Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC).
